Case Presentation

An entire female Yorkshire terrier, 9 years old was presented with a history of a 2 weeks episode of vomiting and diarrhoea. The report of the referring veterinarian revealed fever (39.8°C), anorexia, loss of weight and dullness at clinical examination.

Laboratory Results

The data from haematology and biochemistry are presented in Table 1 and Table 2 respectively. There were no abnormal findings on urinalysis. Clotting times were also normal (PT: 13 seconds, N: 12-17; APTT: 89 seconds, N: 71-102).

Cytology

Direct smears of bile obtained by gallbladder lumen aspiration were stained with Wright's-Giemsa for cytologic examination (Figures 2 and 3).
